ALANOD invests millions

ALANOD invests in a modern coil to coil lacquering line and a further vacuum coating line.

For the last 30 years, ALANOD GmbH & Co. KG has been the leader in surface treatment of coil aluminium, firstly with anodised products and, for the last 14 years, also with coil to coil PVD layer systems.

In furthering the use of cutting edge technology, ALANOD is now investing in a coil to coil lacquering line in Ennepetal for the application of the most modern lacquer systems.

The technology has been tested thoroughly through extensive research and development on a pilot plant over the last 2 years. It is expected this line will offer a yearly capacity of about 2.500 tonnes.

One of the main goals of this highly innovative production line is the application of lacquers for weather resistant reflector and absorber surfaces for the solar industry.

Of course, surface coating of other metallic and non-metallic substrates for various applications will also be possible. It is expected that the lacquering line will be commissioned in April / May 2009.

In a further step - planned for the end of 2009 - ALANOD will also be continuing to invest in cutting edge technology with their new 5th vacuum coating line to be added to the four lines already in operation.

ALANOD is continuing to lead the way by developing its own innovative technology to meet all the requirements of the market for different and highly demanding surfaces, all available from a single source.

As a result of these further investments, ALANOD continues to consolidate and lead the market in the surface treatment of metal coils.
